6	PHYS-545	Signal Processing and Communication	SC	3	
7	PHYS-546	Power Electronics and Microcontrollers	SC	3	
8	PHYS-547	Visual Programming (Pre-requisite: PHYS-436)	SC	3	
9	PHYS-548	Quantum Entanglement	SC	3	
10	PHYS-559	Mathematical Methods in Physics-II	НС	4	

(3 credits)

PHYS-130: PHYSICS LABORATORY

- 1. Simple pendulum.
- 2. Moment of inertia Fly wheel.
- 3. Study of damping of bar pendulum.
- 4. Study of laws of parallel and perpendicular axes theorems (moment of couples).
- 5. Torsion of wire or fiber.
- 6. Kater's pendulum.
- 7. Study of air track.
- 8. Study of gyroscope.
- 9. Study of friction.
- 10. Bifilar pendulum.
- 11. Linear torsion.

Text Books

- 1. H. Singh, B.Sc., Practical physics, S. Chand & Co, (2008), 7th Edition.
- 2. Srinivasan and Balakrishnan, A text book of practical physics. Vols. I & II, S. Viswanathan Publishers, (2000).

Supplementary Reading

- 1. Samir Kumar Ghosh, A text book of practical physics, New Central Book Agency (P) Ltd., (2005) Kolkata.
- 2. B. Ghosh, Advanced practical physics, Vols. I &II, Sreedhar Publishers, Kolkata, (2005), 2nd Edition.

PHYS-131:MECHANICS

(Out of 60 hours per semester, tutorial classes shall be 12 hours)

UNIT - I: Motion in 1D and 2D

Basic concepts and definitions in Mechanics – Newton's laws – Conservation laws – Relative motion – Condition for equilibrium – Lami's theorem – Resolution of forces – Nature or types of forces – Freely falling body – Linear harmonic oscillator – Damped oscillator – Motion of a projectile – Simple pendulum – Validity for small oscillations – Curvilinear motion in Polar co-ordinates – Analytical problems solving.

UNIT - II: Central forces

Force and acceleration – Kepler problem – Inverse square law – Turning points in potential energy curve – Equation of orbits – Circular orbit – Elliptic orbit – Escape velocity – Application to geostationary satellites – Analytical problems solving.

UNIT – III: Particles under Friction

Basic concepts – Static friction – Kinetic friction – Climbing on ladder – Banking of curves – Application of Newtons laws – Analytical problems solving.

UNIT - IV: Systems of Particles

Basic concepts – Concept of center of mass – Calculation of center of mass of certain geometrical objects like an arc of a circle, rectangle, triangle, solid hemisphere, solid cone and similar simple objects – Conservation laws for a system of particles – Variable mass problems – Analytical problems solving.

UNIT - V: Mechanics of Rigid bodies

Definition of moment of inertia – Calculation of moment of inertia of simple objects like a triangle about different axes, a cone and similar objects – Angular momentum of a rigid body – Observables in terms of moment of inertia – Ballistic pendulum – Definition of pure rolling – Problems involving rolling down of simple objects – Analytical problems solving.

UNIT – VI: Collisions

Meaning of collision – Elastic and inelastic collisions – Conservation laws in elastic and inelastic collisions – Introduction to laboratory and center-of-mass coordinate systems – Relationship between laboratory and center-of-mass systems – Analytical problems solving.

Textbooks

- 1. Daniel Kleppner and Robert Kolenkow, An Introduction to Mechanics, McGraw Hill, (1973).
- 2. M. R. Spiegel, Schaum's Outline of Theoretical Mechanics, McGraw Hill.

Supplementary Reading

- David Halliday, Robert Resnick and Jearl Walker, Fundamentals of Physics, John Wiley & Sons, (2004), 7th Edition.
- 2. Fowles Cassiday, Analytical Mechanics, Thomson Brooks/Cole, (2004), 7th Edition.
- 3. Y. R. Waghmare, Classical Mechanics, Prentice Hall of India, New Delhi, (1990).
- 4. John R. Taylor, Classical Mechanics, University Science Books, (2005).
- 5. Keith R. Symon, Mechanics, Addison-Wesley, (1971), 3rd Edition.
- 6. A. P. French, Newtonian Mechanics, M.I.T. Introductory Physics Series, Norton Publishing, (1971).

10 hours

10 hours

10 hours

5 hours

10 hours

5

15 hours

(3 credits)

PHYS-140: PHYSICS LABORATORY (2 credits)

- 1. Thermal conduction of poor conductor.
- 2. Study of potentiometer thermocouple.
- 3. Specific heat of cooling Method of cooling.
- 4. Joule's calorimeter.
- 5. Latent heat of fusion of ice Method of mixtures.
- 6. Specific heat of bad conductor.
- 7. Specific heat of liquid using ice.
- 8. Determination of Steafan's constant.
- 9. Determination of Boltzmann curve.
- 10. Thermal conductivity of glass.
- 11. Study of cooling curve.
- 12. Forbe's method for good conductor.

Text Books

- 1. H. Singh, B.Sc., Practical physics, S. Chand & Co, (2008), 7th Edition.
- 2. Srinivasan and Balakrishnan, A text book of practical physics. Vols. I & II, S. Viswanathan Publishers, (2000).

Supplementary Reading

- 1. Samir Kumar Ghosh, A text book of practical physics, New Central Book Agency (P) Ltd., (2005) Kolkata.
- 2. B. Ghosh, Advanced practical physics, Vols. I &II, Sreedhar Publishers, Kolkata, (2005), 2nd Edition.

PHYS-141: THERMAL PHYSICS AND KINETIC THEORY

(Out of 60 hours per semester, tutorial classes shall be 12 hours)

UNIT – I:

Thermodynamics as phenomenological science – Thermodynamic systems – Closed, open, isolated systems – Thermodynamic processes – Adiabatic, isothermal, isochoric, isobaric, isentropic, cyclical and free expansion processes – Reversible, irreversible and Quasi-static processes – Equation of state – Intensive and extensive variables – The P-V diagram – Path and Point functions – Thermal equilibrium and zeroth law of thermodynamics – Measuring temperature – Triple point of water as reference – Thermal expansion – Linear and volume expansion coefficients – Isothermal compressibility – Relations between partial derivatives – Exact differentials – Internal energy function – Mathematical formulation of first law – Differential form of first law – Heat flow and its path dependence – Problems solving.

UNIT – II:

Conversion of work into heat and vice-versa – Efficiency – Kelvin-Planck statement of the second law of thermodynamics – Clausius statement of the second law – Carnot cycle – Carnot refrigerator – Carnot's theorem and corollary – Thermodynamic temperature scale – Absolute zero and Carnot efficiency – Derivation of Clausius' theorem – P-V, P-T and T-S diagrams for a pure substance – Problems solving.

UNIT – III:

Equation of state of a gas from Avogadro's law – Ideal gas equation – Specific heat, internal energy and enthalpy of an ideal gas – Entropy change of an ideal gas – Reversible adiabatic process – Reversible isothermal process – van der Waals equation of state – Virial expansions and coefficients – Law of corresponding states – Dalton's law of partial pressures – Internal energy, enthalpy and specific heats of gas mixtures – Entropy of gas mixtures – Maxwell's thermodynamic relations – Derivation of *TDS* equations – Derivation of difference in heat capacities and ratio of heat capacities – Problems solving.

UNIT – IV:

Concept of entropy – Entropy of an ideal gas – The *T-S* diagram – Entropy, reversibility and irreversibility – Conditions for irreversibility – Irreversible part of the second law – Inequalities of Clausius – Entropy in irreversible processes – Entropy and disorder – Application of the entropy principle – Problems solving.

UNIT – V:

Kinetic theory – Basic assumptions – Molecular flux – Derivation of a equation of state, internal energy and pressure for a monoatomic ideal gas from kinetic theory of gases – The principle of equipartition of energy – Distribution of molecular speeds – Maxwell-Boltzmann distribution – Intermolecular forces – Hard sphere model – Collision cross section – Derivation of coefficient of viscosity, thermal conductivity and coefficient of self-diffusion of a gas using kinetic theory – Problems solving.

Textbooks

- 1. M. W. Zemansky and R. H. Dittman, Heat and Thermodynamics, McGraw Hill, (1997), 7th Edition, for Units 1 to IV.
- 2. F. W. Sears and G. L. Salinger, Thermodynamics, Kinetic Theory and Statistical Thermodynamics Narosa, (1990), 3rd Edition, for Unit–V.

Supplementary Reading

- David Halliday, Robert Resnick and Jearl Walker, Fundamentals of Physics, John Wiley & Sons, (2004), 7th Edition.
- 2. Paul A. Tipler and Gene Mosca, Physics for Scientists and Engineers (Extended version), W. H. Freeman and Company, (2007).

(3 credits)

10 hours

10 hours

14 hours

13 hours ersibility –

PHYS-230: PHYSICS LABORATORY

(2 credits)

- 1. Nonlinear torsion by weights
- 2. Frequency of tuning fork by sonometer.
- 3. Melde's string.
- 4. Calibration of ammeter using potentiometer.
- 5. Calibration of voltmeter using potentiometer.
- 6. Study of vibration magnetometer.
- 7. Surface tension by capillary rise.
- 8. Surface tension by method of drops.
- 9. Viscosity of liquids by Poiseuille's method.
- 10. Comparison of viscosities of two liquids by capillary flow method.
- 11. Determination of Young's modulus by non-uniform bending using single optic lever.
- 12. Determination of rigidity modulus by static torsion method.
- 13. Wheatstone's bridge.
- 14. Specific resistance of a metal wire by meter bridge.
- 15. Determination of unknown resistance by Carey-Foster bridge.
- 16. Resistance measurement by ballistic galvanometer.
- 17. Figure of merit of a ballistic galvanometer.
- 18. Comparison of resistances using ballistic galvanometer.

Text Books

- 1. H. Singh, B.Sc., Practical physics, S. Chand & Co, (2008), 7th Edition.
- 2. Srinivasan and Balakrishnan, A text book of practical physics. Vols. I & II, S. Viswanathan Publishers, (2000).

Supplementary Reading

- 1. Samir Kumar Ghosh, A text book of practical physics, New Central Book Agency (P) Ltd., (2005) Kolkata.
- 2. B. Ghosh, Advanced practical physics, Vols. I &II, Sreedhar Publishers, Kolkata, (2005), 2nd Edition.

PHYS-231: PHYSICS OF WAVES and CONTINUOUS MEDIA

(Out of 60 hours per semester, tutorial classes shall be 12 hours)

Unit - I: Simple Harmonic Motion

Simple harmonic motion – Velocity and acceleration in SHM – Energy of a simple harmonic oscillator – Examples of simple harmonic oscillators in electrical systems – Superposition of two simple harmonic vibrations – Superposition of two perpendicular simple harmonic vibrations – Superposition of a large number of simple harmonic vibrations of equal amplitude and uniform phase difference – Damped harmonic oscillator – Introduction to coupled oscillations.

Unit - II: Transverse and Longitudinal Waves

Introduction to transverse waves – Velocities in wave motion – The transverse wave equation – Solution of the transverse wave equation – Standing waves on a string of fixed length – Energy of a vibrating string – Standing wave ratio – Wave groups and group velocity – Doppler effect – Examples of waves in optical systems – Introduction to longitudinal waves – Sound waves in gases – Energy distribution in sound waves – Intensity of sound waves – Longitudinal waves in a solid - Example of earthquake – Reflection and transmission of sound waves at boundaries – Noise and music – Limits of human audibility – The decibel unit – Diffraction of sound waves – Introduction to acoustic transducers – Acoustics of auditoriums and halls – Reverberation time.

Unit - III: Waves in more than one dimension

Plane wave representation in two and three dimensions – Wave equation in two dimensions – Solution by method of separation of variables – Introduction to normal modes in two dimensional case – Reflection and transmission of a three-dimensional wave at a plane boundary – Example of total internal reflection and evanescent waves.

Unit - IV: Continuous Media (Solids)

Solids as continuous media – Elastic properties of solids – Elastic constants and their inter-relation – Torsion of a cylinder – Bending of beams.

Unit - V: Continuous Media (Fluids)

Fluids as continuous media – Flow properties of liquids – Flow of ideal liquids – Bernoulli's theorem – Flow of real liquids – Viscosity – Newtonian and non-Newtonian fluids – Reynolds number – Streamline and turbulent flows – Stoke's law – Surface energy and surface tension.

Textbooks

- 1. H. J. Pain, The Physics of Vibrations and Waves, John Wiley, (2005), 6th Edition, for Units I, II & III.
- 2. D. S. Mathur, Elements of Properties of Matter, S. Chand & Co., (2005), 11th Edition, for Units IV & V

Supplementary Reading

- David Halliday, Robert Resnick and Jearl Walker, Fundamentals of Physics, John Wiley & Sons (2004), 7th Edition.
- 2. Berkeley Physics Course-Waves: Volume-III, McGraw Hill, (1969).
- 3. A. P. French, Vibrations and Waves (M.I.T Introductory Physics Series), CRC Press, (1971).
- 4. Lawrence E. Kinsler, Austin R. Frey, Alan B. Coppens and James V. Sanders, Fundamentals of Acoustics, John Wiley, (2000).
- 5. Richard P. Feynman, Robert B. Leighton, Matthew Sands, Feynman Lectures on Physics: The Definitive and Extended Edition. Addison-Wesley, (2005), 2nd Edition.
- 6. F. H. Newman and V. H. L. Searle, The General Properties of Matter, Edward Arnold (1961).
- 7. B. H. Flowers, Properties of Matter, John Wiley, (1970).

(3 credits)

10 hours

10 hours

12 hours

13 hours

PHYS-232: ELECTRICITY AND MAGNETISM

(Out of 60 hours per semester, tutorial classes shall be 12 hours)

UNIT – I: Electrostatics

Review of vector calculus - Divergence, Curl and Gradient operators - Vector identities - Coulomb's law -Electric flux and flux density - Discrete and continuous charge distributions - Electric field due to discrete and continuous charge distributions - Calculation of electric field due to the following: an infinitely long line charge, a sheet of charge, a ring of charge, a charged disk – Electric field due to an electric dipole – Gauss's law - Applications of Gauss's law for the following symmetric charge distributions: Point charge. Infinite line charge, Infinite sheet of charge, Uniformly charged sphere (solid and shell) and cylinder – Electric dipole in an electric field - Torque - Motion of point charges in electric fields - Problems solving.

UNIT - II: Work and energy in electrostatics

Work and energy in electrostatic systems – Electric potential – Definition of potential difference and potential – Calculating the potential from the field and vice-versa – Potential inside and outside of a spherical shell of charge - Equipotential lines and surfaces - Energy expended in moving a point charge in an electric field -Calculation of electric potential due to a system of discrete charges and continuous charge distributions -Potential gradient - Derivation of energy density in an electrostatic field - Potential energy of an electric dipole in an electric field – Calculation of energy density due to symmetric charge distributions – Problems solving.

UNIT – III: Conductors, Dielectrics and Capacitors

Properties of conductors - Discontinuity of electric field on the surface of a conductor - Electric current density - Derivation of drift velocity, Ohm's law - Microscopic view of Ohm's law - Derivation of resistivity, resistance and power in a current carrying conductor - Nature of dielectric materials - Definition of electric polarization - Dielectric breakdown - Capacitors - Calculating the capacitance of a parallel plate capacitor, a cylindrical capacitor, a spherical capacitor, coaxial cylindrical capacitor, concentric spherical capacitor and for an isolated spherical capacitor - Capacitor with a dielectric - Gauss's law in presence of linear dielectrics -Capacitance of a two-wire line - Problems solving.

UNIT – IV: Magnetic fields

Biot-Savart's law - Motion of charged particles in magnetic fields - Circulating charged particle and helical paths - Magnetic force on a current carrying wire - Torque on a current loop - Magnetic dipole moment of a magnetic dipole - Calculation of magnetic field due the following: a long straight wire, a circular arc of wire -Force between two parallel currents - Non-existence of magnetic monopoles - Ampere's law - Applications of Ampere's law to calculate magnetic field due to following symmetric current distributions: a long straight current carrying wire, a solenoid and toroid - Equivalence of current carrying loop and a magnetic dipole -Faraday's law of induction - Lenz's law - Induction and energy transfers - Motional e.m.f - Eddy currents -Inductance of a solenoid – Self induction of a coil – Mutual induction – Energy stored in a magnetic field – Calculation of magnetic energy density - Problems solving.

UNIT - V: Maxwell's equations

Introduction to Maxwell's equation in vacuum and in material media - Derivation of electromagnetic wave equation from Maxwell's equations.

Textbook

1. David Halliday, Robert Resnick and Jearl Walker, Fundamentals of Physics, John Wiley & Sons, (2004), 7th Edition.

Supplementary reading

- Paul A. Tipler and Gene Mosca, Physics for Scientists and Engineers (Extended version), W. H. 1. Freeman and Company, (2007).
- 2. Matthew and N. O. Sadiku, Elements of Electromagnetics, Oxford University Press, (2002), 3rd Edition.

(3 credits)

13 hours

13 hours

8 hours

13 hours

PHYS-240: PHYSICS LABORATORY

(2 credits)

- 1. Determination of e/m by Millikan's method.
- 2. Determination of e/m using Thomson's method.
- 3. Determination of Planck's constant.
- 4. Verification of Norton's theorem.
- 5. Verification of Thevenin's theorem.
- 6. Verification of superposition theorem.
- 7. Verification of reciprocity theorem.
- 8. Study of CRO fundamentals.
- 9. Study of passive filter (a) waveform and (b) frequency response.
- 10. Study of RC circuit.
- 11. Study of LCR circuit.
- 12. Study of LC circuit.
- 13. Frequency response of series LCR circuit.
- 14. Frequency response of parallel LCR circuit.
- 15. Study of AC bridges.

Text Books

- 1. H. Singh, B.Sc., Practical physics, S. Chand & Co, (2008), 7th Edition.
- 2. Srinivasan and Balakrishnan, A text book of practical physics. Vols. I & II, S. Viswanathan Publishers, (2000).

Supplementary Reading

- 1. Samir Kumar Ghosh, A text book of practical physics, New Central Book Agency (P) Ltd., (2005) Kolkata.
- 2. B. Ghosh, Advanced practical physics, Vols. I &II, Sreedhar Publishers, Kolkata, (2005), 2nd Edition.

11

PHYS-241: MODERN PHYSICS - I

(Out of 60 hours per semester, tutorial classes shall be 12 hours)

Unit - I: Dual nature

EM waves - Black body radiation - Photoelectric effect - X-rays - Diffraction of x-rays - Compton effect de Broglie waves - Phase and group velocities - Electron diffraction - Uncertainty principle - Problems solving.

Unit-II : Atomic structure

Electron orbits - Atomic spectra - Bohr atom - Energy levels and spectra - Sommerfeld model - Vector atom model - Canonical quantization - Problems solving.

Unit-III : Quantum mechanics

Wave equation – Schrödinger equation – Operators – Postulates of quantum mechanics – Particle in a box – Finite potential well - Introduction to quantum tunneling - Harmonic oscillator - Problems solving.

Unit-IV: Hydrogen atom

Schrödinger equation - Separation of variable - Quantum numbers - Quantization of energy - Angular momentum - Electron Probability density - Radiative transition - Selection rules - Zeeman effect - Spin of the electron.

Unit-V: Atoms and Molecules

Hund's rules – Pauli's exclusion principle – Periodic table – Spin-orbit coupling – Total angular momentum – Molecular bond – Hydrogen molecule – Rotational energy levels – Vibrational energy levels – Electron spectra of molecules.

Textbook

1. Arthur Beiser, Concepts of Modern Physics, Tata McGraw Hill, (2002), 6th Edition.

Supplementary Reading

- 1. H. S. Mani and G. K. Metha, Introduction to Modern Physics, Affiliated East-West Press, (1988).
- 2. David Halliday, Robert Resnick and Jearl Walker, Fundamentals of Physics, John Wiley & Sons, (2004), 7th Edition.
- 3. Paul A. Tipler and Gene Mosca, Physics for Scientists and Engineers (Extended version), W. H. Freeman and Company, (2007).
- 4. F. K. Richtmyer, E. H. Kennard and J. N. Cooper, Introduction to Modern Physics, Tata McGraw Hill, (1976), 6th Edition.
- 5. M. R. Wehr, J. A. Richards Jr and T. W. Adair, Physics of the atom, Narosa Publishing House, (1985). 4th Edition

(3 credits)

12 hours

12 hours

12 hours

12 hours

PHYS - 242: ELECTRIC CIRCUITS THEORY

(Out of 60 hours per semester, tutorial classes shall be 12 hours)

UNIT – I: Series-Parallel Networks

Review of current electricity - Kirchhoff's laws - Ladder networks - Current sources - Conversion of current source to voltage source - Current sources in series and parallel - Mesh analysis - Nodal analysis - Bridge networks - Y to Delta and Delta to Y conversion - Problems solving.

UNIT – II: Network Theorems

Superposition theorem – Thevenin's theorem – Norton's theorem – Maximum power transfer theorem – Millman's theorem - Substitution theorem - Reciprocity theorem - Problems solving.

UNIT - III: Capacitative, Inductive and Magnetic Circuits

Transients in capacitative networks - Time constant - Capacitor networks - Energy relations - Introduction to Magnetic circuit - Reluctance - Series and parallel magnetic circuits - Analogy between electromotive force (e.m.f) and magnetomotive force (m.m.f) - Inductors - resistor-inductor (RL) transients - Time constant -Problems solving.

UNIT - IV: AC circuits

Introduction to a.c waveforms - Definition of terminology - Average and effective values - Introduction to phasor notation - Response of basic R, L and C elements to a sinusoidal signal - Frequency response - Power factor - Series and parallel a.c circuits - Impedance and phase diagram - Voltage divider rule for a.c circuits -Current divider rule for a.c circuits – Power in a.c circuits – The power triangle – Problems solving.

UNIT -V: Resonance

Introduction to resonance - Series LCR resonant circuit - Q-factor - Variation of impedance with frequency -Selectivity of a series resonant circuit – Parallel LCR resonant circuit – O-factor – Selectivity curves – Application to tuned filters - Bode plots - Problems solving.

Textbook

1. Robert L. Boylestad, Introductory Circuit Analysis, Prentice Hall, (2006), 11th Edition.

Supplementary Reading

- 1. Charles Alexander and Matthew Sadiku, Fundamentals of Electric Circuits, McGraw Hill, (2006), 3rd Edition.
- 2. Thomas L. Floyd, Electric Circuit Fundamentals, Prentice Hall, (2006), 7th Edition.

12 hours

(3 credits)

12 hours

12 hours

12 hours

PHYS – 330: PHYSICS LABORATORY

(2 credits)

- 1. Determination of self inductance of a coil using Anderson's bridge.
- 2. Determination of mutual inductance between a pair of coils (Carey-Fosters method).
- 3. Determination of magnetic field using Hall probe.
- 4. Determination of band gap of a semiconductor using two probe method.
- 5. Determination of magnetic flux of an electromagnet.
- 6. Determination of magnetic susceptibility of a liquid by Quinck's method.
- 7. Determination of magnetic susceptibility of a solid by Guoy's method.
- 8. Determination of Curie temperature of a ferromagnetic material.
- 9. Study of I-V characteristics of a junction diode.
- 10. Clipping and clamping circuits using junction diode.
- 11. Half wave, full wave and bridge rectifier using diodes.
- 12. Study of rectifaers using C, L-C and pi filters.
- 13. Study of I-V characteristics and voltage regulation by Zener dhode.
- 14. Study of bipolar junction transistor charabteristacs (a) CB, (b) CE and (c) CC.

Text Books

- 1. H. Singh, B.Sc., Practical physics, S. Chand & Co, (2008), 7th Edition.
- 2. Srinivasan and Balakrishnan, A text book of praatical physias. Vols. I & II, S. Viswanathan Publishers, (2000).

Supplementary Beading

- 1. Samir Kumar Ghosh, A text book of practical physics, New Central Book Agency (P) Ltd., (2005) Kolkata.
- 2. B. Ghosh, Advanced practical physics, Vols. I &II, Sreedhar Publishers, Kolkata, (2005), 2nd Edition.

15

PHYS-331: CLASSICAL OPTICS

(Out of 60 hours per semester, tutorial classes shall be 12 hours)

UNIT - I: GEOMETRICAL OPTICS

Fermat's principle: Principle of extreme path: the aplanatic points of a sphere and other applications - General theory of image formation: Cardinal points of an optical system; general relationships, thick lens and lens combinations, telephoto lenses.

UNIT - II: OPTICAL INSTRUMENTS

Aberration in images: chromatic aberrations; achromatic combination of lenses in contact and separated lenses. Monochromatic aberrations and their reduction; aspherical mirrors and Schmidt corrector plates, oil immersion objectives, meniscus lenses. Optical instruments: Entrance and exit pupils, need for a multiple lens eyepiece, common type of eyepieces.

UNIT – III: INTERFERENCE

Interference of light: The principle of superposition; two-slit interference, coherence requirements for the sources, localized fringes in thin films, transition from fringes of equal thickness to those of equal inclination -Michelson interferometer; its uses for determination of wavelength, wavelength difference and standardization of the meter. Intensity distribution in multiple beam interference; Tolansky fringes, Fabry-Perot interferometer and etalon.

UNIT - IV: FRESNEL DIFFRACTION

Fresnel diffraction: Half-period zones, circular apertures and obstacles, straight edge, explanation of rectilinear propagation. Cornu Spiral and its applications Babinet's Principle.

UNIT - V: FRAUNHOFER DIFFRACTION

Fraunhofer diffraction: Diffraction at a slit, a circular aperture and a circular disc. Resolution of images; Rayleigh criterion, resolving power of a telescope and a microscope - Diffraction grating: Diffraction at N parallel slits; plane diffraction grating, concave grating, resolving power of gratings and prisms.

Textbooks

- 1. A. K. Ghatak, Optics, Tata McGraw Hill, 3rd Edition.
- 2. Eugene Hecht, Optics, Addison Wesley, (2001), 4th Edition.
- 3. F. L. Pedrotti and L. S. Pedrotti, Introduction to Optics, Prentice Hall International, 2nd Edition.
- 4. K. K. Sharma, Optics, Elsevier.

Supplementary Readings

- 1. R. P. Feynman, R. B. Leighton, M. Sands, The Feynman Lectures on Physics, Vol. I, Narosa (1998).
- 2. Born and Wolf, Optics, Pergamon Press.
- 3. K. D. Meller, Optics, Oxford University Press.
- 4. Jenkins and White, Fundamental of Optics, McGraw-Hill.
- 5. B. B. Laud, Lasers and Non-linear Optics, Wiley Eastern, (1985).

PHYS-332: ELECTRONIC DEVICES and CIRCUITS

(Out of 60 hours per semester, tutorial classes shall be 12 hours)

Unit - I: Semiconductor Diodes

Basis of Semiconductor Physics: Semiconductor diodes: p-n junction diode, I-V characteristics, Schockley model, application in rectifiers, clippers and limiters, Zener diode and its applications, optoelectronic diodes: LED, photodiodes, optocouplers.

Unit - II: Transistor Characteristics

Bipolar junction transistors (BJT): pnp and npn structures; active and saturation regions, characteristics of BJT, common-emitter configuration, input and output characteristics, B-parameter, common-base configuration, output characteristics, Common-collector configuration.

Unit - III: Transistor- low frequencies & Biasing and Stabilization

Two-port analysis of a transistor, Transistor hybrid model-definition of h-parameters- Analysis of a Transistor amplifier circuit using h-parameters, Thevenin's and Norton's theorems and corollaries - Emitter follower, Linear analysis of a Transistor circuit, Miller' theorem and its dual, Simplified hybrid models of CE, CE amplifier with an Emitter resistance, Load line concept, biasing methods, stability factor, Bias compensation.

Unit - IV: Field Effect Transistor

Field effect transistor (FET): Classification of various types of FETs, constructional details of junction fieldeffect transistor, drain characteristics of JFET, biasing of JFET, operating regions, pinch-off voltage, idea of metal-oxide-semiconductor transistor (MOS transistor).

Unit - V: Amplifiers

Classification of amplifiers, Distortion in amplifiers, frequency response of amplifiers: LC and CR response, band with and rise time, amplifier, flat band equivalent circuits with and without input and output loading, cascade connections. Decibel power, gain and loss. Conversion to voltage and current gain.

Unit - VI: Feedback amplifiers & Oscillators

Classification of Amplifiers, Feedback concept, General characteristics of Negative feedback amplifiers, Oscillators and wave-form generators: Positive feedback, Barkhausen criterion, RC oscillator, Wein Bridge oscillator, Phase shift oscillator, Colpitt's oscillator, Hartley oscillator.

Text Book

1. J. Millman and C. C. Hallkias, Integrated Electronics: Analog and digital circuits and systems, Tata McGraw Hill.

Supplementary Reading

PHYS-333: MODERN PHYSICS – II

(Out of 60 hours per semester, tutorial classes shall be 12 hours)

Unit - I: Special theory of Relativity

Postulates – Lorenz transformations – Time dilation – Length contraction – Doppler effect – Twin paradox – velocity addition – relativistic momentum – Mass energy equivalence – Electricity and Magnetism in relativity – Introduction to general relativity.

Unit - II: Statistical Mechanics

Different statistical distributions – Maxwell Boltzmann-Statistics-Molecular energies in an ideal gas-Quantum statistics: Fermi-Dirac and Bose-Einstein statistics-Black body radiation – Rayleigh-Jeans formula – Planck's law and Einstein's approach – Specific heat of solids – Free electron in metals.

Unit - III: Nuclear physics:

Introduction to nucleus – Nuclear mass – Nuclear size – Constituents of the nucleus – Binding energy – Stable nuclei – Liquid drop model – Radioactive decay – Alpha decay – Beta decay – Gamma decay – Nuclear energy – Nuclear fission – Nuclear reactors – Uncontrolled chain reactions – Nuclear fusion – Fusion in stars.

Unit - IV: Introduction to Particle physics:

Introduction – Properties of elementary particles – Classification and names of elementary particles – Introduction to hardons and leptons – Introduction to conservation laws in elementary particles – Introduction to fundamental interactions.

Textbook

1. Arthur Beiser, Concepts of Modern Physics, Tata McGraw Hill, (2002), 6th Edition.

Supplementary reading

- 1. H. S. Mani and G. K. Metha, Introduction to Modern Physics, Affiliated East-West Press, (1988).
- David Halliday, Robert Resnick and Jearl Walker, Fundamentals of Physics, John Wiley & Sons, (2004), 7th Edition.

PHYS-340: PHYSICS LABORATORY

(2 credits)

- 1. Dispersive power of a material and linear dispersion in prism using cross-wired eye piece.
- 2. Study of interference fringes in biprism arrangement.
- 3. Use of Newton's ring to determine the radius of curvature.
- 4. Michelson's interferometer.
- 5. Diffraction of light with circular aperture using He-Ne laser.
- 6. Fraunhoffer diffraction at a single slit using He-Ne laser.
- 7. Minimum deviation and first order spectra of grating.
- 8. Determination of wavelength of He-Ne laser using meter scale.
- 9. Fraunhoffer diffraction pattern of a mesh.
- 10. Pitch of screw gauge using Fraunhoffer diffraction.
- 11. Measure of thickness of sleeve using diffraction.
- 12. Specific rotation of sugar solution by polarimeter.
- 13. Study of transmission grating.
- 14. Verification of Malus law using half and quarter wave plate.
- 15. Use of Fresnel zone plate.
- 16. Study of narrow angle prism.
- 17. Fresnel diffraction at single slit.

Text Books

- 2. B. Ghosh, Advanced practical physics, Vols. I &II, Sreedhar Publishers, Kolkata, (2005), 2nd Edition.

PH – 341: COMPUTATIONAL PHYSICS

(Out of 60 hours per semester, tutorial classes shall be 12 hours)

UNIT – I:

Computers in physics - Fortran language – algorithms – flowchart – I/O statements-arithmetic control statement – Do ctatement –subscribed variables – format specifications – subroutine – unstructured and structured txpe - Random numbers – Properties of random numbers.

UNIT – II:

Solutions of transcendental equation – polynomial equations – Newton – Raphsln method – hterative method – successive bisection method, numerical differentiation and integration – Simpson rule – Linear algebraic equation and matrices – Cramer's rule Jacobi iethod –

ULIT – III:

Eigen value ppoblems – Solutions of differential equation – Euler, pica and Rulge-Iutta methods - Curve fitting – evaluation of linear parameters weighter least square fitting – Binomial, Poisson, Norm'l distribution chi square and goodness of fit-student – distribution.

UNIT -IV:

Applications in Mechanicc and Statistical Mechanics: One-dimensional motion - two dimensional motion - Three body mechanics - Classical scatdering - Two-dimensional motion given the potential - The *l*-body gas - Statistical average Gas with random collision.

ULIT -V:

Applications in Optics and Modern Physics: Fourier series-Fourier transfore-Strategy for dispersive wave – Wave addition Standing gaves – Huygen's constructions – Black body radiation-Lorentz contraction – Speed of light distortion – Symmetric one and three dimensional potential – one dimensional wave packets.

Textbooks

- 1. Richard Hamming, Numerical Methods for Scientists and Engineers, Dover publications.
- 2. V. Rajaraman, Programming in FORTRAN 77, Prentice Hall of India.

PHYS-342: BASICS OF MATERIALS SCIENCE

(Out of 60 hours per semester, tutorial classes shall be 12 hours)

UNIT – I:

Introduction to materials science - Classification of engineering materials - Structure-property relationships -Stability and meta-stability - Basic thermodynamic functions and related processes - Introduction to phase diagrams - Phase rule - Lever rule - One and two components - Solid solution - Eutectic binary mixtures -Microstructural changes during cooling – Typical phase diagrams and their applications.

UNIT – II:

Introduction to crystals - Classification of crystal systems - Introduction to Bravais lattice - Calculation of distance between crystal planes - Miller indices - ionic crystals-covalent crystals- Vander wall-Metallic bonds.

UNIT – III:

Atomic processes in solids - Diffusion in solids- Self diffusion - Concentration gradient-Diffusion constant -Fick's laws of diffusion and its applications.

UNIT – IV:

Introduction to band theory of solids - Classification of metals, insulators and semiconductors - Forbidden gap - Mechanical properties of materials - Elastic deformation - Fracture - Plastic deformation Slip - Critical shear stress - Effect of lattice defects on mechanical properties.

UNIT – V:

Material `reparation and characterization - Different techniques of growing crystals -Melt growth - Growth of thin films- Characterisation by X-ray and optical methodr.

Textbook

Supplementary Reading

- 1. W.D.Callistin, Material Science and Engineering, John Viley Sons.
- 2. Meissel and Glong, Hand book of thin film technology, McGraw Hill.

^{1.} V. Paghavan, Material Science and Engineering, Prentice-Hall.

PHYS-343: MODERN OPTICS

(Out of 60 hours per semeste2, tqtorial classes shall be 12 hours)

UNIT – I:

Double refraction and optical rotation: Double refraction in uniaxial crystals(explanation in terms of electromagnetic theory, phase retardation plates. Rotation mf plane of polarization, origin of optical rotation in liquids afd in crystals. Dispersion and scattering: Theory of dispersion of lig't; absorption bands ald anomalous dispersion. Theory of Rayleigh scattering; scattering of X-rays and determination of Z of an atom.

UNIT – II:

Introduction to Laser as Coherent Source of lig't: Puridy of a spectral line; coherence length and coherence time, spatial coherence and directionality, estimates of beam intensity. Temporal coherence and spectral energy density.

UNIT – III:

Statistical properties of random light, concept of coherence, interference of partially coherent light. Coherence Time and Line width via Fourier Analysis- Spatial Coherence and Temporal Coherence Michelson Stellar Interferometer Fourier Transform Spectroscopy. Holography- Introduction Theory Requirements and some applications.

UNIT – IV:

Fiber Optics - Introduction -Optical Fiber- Coherent Bundle- Numerical Aperture Single and Multimode Fibers-Pulse Dispersion - Waveguide Dispersion-Dispersion Compensating Fibers.

Textbooks

- 1. A. K. Ghatak, Optics, Tata McGraw Hill, 3rd Edition.

PHY- 344 - Geomagnetism and Paleomagnetism

Geomagnetism Introduction to different geomagnetic signatures of the past – geo, palaeo and archaeomagnetisms – Main features and origin of geomagnetic field - geo magnetic field variation - diurnal variation - annual and secular variation of geomagnetic field- Geocentric axial diploe- magnetic latitude and longitude - Location of present day geomagnetic poles- Paleomagnetic pole.

Physical Basis of Magnetism Magnetic susceptibility – permeability- hysteresis loop- role of electron orbits and spin in atoms- dia, para, ferro, ferri and anti ferro magnetisms (introductory level with expressions for magnetic susceptibility)-Magnetic domains.

Magnetic Minerology Magnetic minerals- structure of magnetite and hematite, Magnetite - Ulvospinal solid solution series -Haematite-Ilmenite solid solution series.

UNIT - IV

UNIT – III

UNIT-I

UNIT-II

Remanent Magnetism and Measurement Techniques

Various types of remanent magnetisms- Measurement of remanent magnetism- magnetic directions - oriented sample- Astatic, spinner, SQUID magnetometers - magnetic susceptibility meter. Primary component of magnetization- demagnetization techniques

UNIT – V

Magnetic Dating of Formation

Magnetic directions- Virtual geomagnetic poles- plotting of remanent magnetic data of using stereonet introduction to polar wander - Polar wander path - movement of continents- estimation of age of formation.

Books:

PHYS-431: MATHEMATICAL METHODS IN PHYSICS -I

Unit I: Differential Equations

Basic Ideas -Ordinary Differential Equations - Partial Differential Equations - Heat equation - Wave equation - Laplace equation - Boundary value problems –Method of Separation of Variables - Linear ordinary differential equations with constant coefficients and the Euler equation -Frobenius method of series solution – Strum-LiouvIlieproblem – Orthogonal eigenfunction expansions.

UNIT – II: Special Function

Beta, Gamma, Delta and Error functions – Bessel, Hermite, Legendre, Associated Legendre and Laguerre functions – Generating functions – Recurrence relations – Applications in physics.

Unit II: Complex Variables

Introduction – Elements of analytic function theory – Cauchy-Riemann conditions – Singularities, poles and essential singularities – Cauchy's integral theorem – Cauchy integral formula – Taylor, Maclaurin and Laurent series of complex functions – Residue theorem - Applications of Residue theorem.

UNITIII: Fourier Transforms

Introduction to Fourier analysis – Half range Fourier series – Harmonic analysis and applications – Forcedoscillations – Finite and infinite Fourier transforms – Fourier sine and cosine transforms – Complex Fouriertransforms – Fourier expansion and inversion formulas – Convolution theorem – Applications to solutions ofpartial differential equations.

UNIT V: Laplace Transforms

Laplace transforms – Inverse transforms – Linearity and Shifting theorems – Laplace transform of derivative of a function – Laplace transform of integral of a function – Unitstepfunction – t-shifting – Short impulses – Diracdeltafunction – Convolution – Integral equations – Application to solve differential equations.

PHYS- 432: CLASSICAL MECHANICS

Unit I:

Mechanics of a system of particles – conservation laws of linear and angular momenta for systems not subjected to external forces and torques – constraints – principle of virtual work – Lagrangian equations of motion and a few applications – motion in a central field – Kepler's problem – scattering – laboratory and CM frame – differential scattering cross section – scattering by a central field.

Unit II:

Variational method – Hamilton's equations of motion – canonical transformations – generating functions – infinitesimal contact transformations – Lagrange and Poisson brackets – Hamilton, Jacobi theory.

Unit III:

Rigid body rotation – rotating frame – Eulerian angles transformation between rotating and stationery frames – Coriolis and centrifugal forces – moment of inertia tensor – Euler's equations – symmetric top precession – theory of small oscillations – normal co-ordinates and vibrations of a discrete system – Forced oscillations.

Unit IV:

15 hours

Special theory of relativity: Inertial frames – Lorentz transformations – length contraction, time dilation and Doppler effect – Minkowski space – Energy momentum four vectors – Introduction to general relativity.

Text Book

PHYS-434: ELECTRONIC DEVICES, CIRCUITS AND MICROPROCESSORS

Unit-I

Semiconductor Diodes: Operation, characteristics and applications of Zener and Avalanche, Varactor, Schottky- barrier, Tunnel diodes; Construction, operation and Characteristics of BJT, FET and MOSFET- FET amplifier - UJT relaxation oscillator. 13hours

Unit-II

Operational amplifiers: Basics of differential amplifiers-Characteristics of ideal and practical opamps-Applications; inverting, non-inverting, Summing, difference, integrating, differentiating amplifiers- Signal processing circuits, precision rectifiers, clipper, clamper and peak detectors-Signal generators; triangular and square wave generators, phase shift and Wien bridge oscillator using opamps. Active filters; First order low pass and high pass filters. Band pass and band elimination filters-Temperature compensated logarithmic and antilogarithmic amplifiers.

Unit-III

Digital Circuits: Logic circuits using standard TTL and CMOS-Combinational circuits: Adders, subtractors, multiplexer/demultiplexer, decoder and encoders-Flip Flops; S-R, J-K, Master slave S-R and Master slave J-K Flip Flop-counters; synchronous, asynchronous, Modulo-n-counters-shift registers; Serial to parallel and viceversa, universal shift registors, ring counter.

UNIT – IV:

Opto-electronics: Radiative and nonradiative transition, Light dependent resistor (LDR), Photodiodes, phototransistors, Photovoltaic (Solar) cell Materials, construction and operation of LED, Diode laser; Structure, Working and factors affecting performance.

UNIT – V:

hours

Microprocessors and Microcontrollers: Fundamentals of computer architecture; Processor design; Control unit design; Memory organisation, I/o System Organisation. Microprocessors and Microcontrollers: Architecture and instruction set of 8085 and 8051, Assembly language Programming; addition, subtraction and multiplication.

PHYS - 435: NUMERICAL METHODS

UNIT – I

Representing numbers in a computer – Machine precision – Introduction to numerical errors – Errors in mathematical approximations – Error propagation.

UNIT – II

Matrices and linear system of equations – GaussJordan elimination method – Gauss method to compute the Inverse – LU decomposition – Cholesky decomposition – GaussSeidel iterative method – Eigenvalues and eigenvectors of a real symmetric matrix by Jacobi's method – Determination of largest eigenvalue by Power method.

UNIT – III

Numerical solution of ordinary differential equations solution by Taylor's series – Euler's method – Runge Kutta methods with Runge's coefficients. Numerical solution of partial differential equations using finite difference method.

$\mathbf{UNIT} - \mathbf{IV}$

Laboratory Exercise Session : The laboratory exercise involves writing programs in FORTRAN to solve problems of numerical techniques for the topics listed above.

Textbook:

1. Richard Hamming. Numerical Methods for Scientists and Engineers. Dover publications.

2. Duane C. Hanselman and Bruce L. Littlefield (2004). Mastering MATLAB 7. Prentice Hall.

Supplementary Reading

1. J.M. Thijssen (1999). Computational Physics. Cambridge University Press.

2. Tao Pang (1997). An Introduction to computational physics. Cambridge University Press.

3. Rubin H. Landau (1997). Computational Physics: Problem solving with computers. John Wiley.

4. James B. Scarborough. Numerical mathematical analysis. Oxford IBH.

(3credits)

PH-436: UNIX, FORTRAN-90 and C++

UNIT – I: Unix Operating System

Introduction to operating system – General OS architecture – Evolution of Unix operating system – Architecture of the Unix OS – The kernel – Memory management – Virtual memory – Paging – Segmentation – Shells and GUI – Directory structure – File systems in Unix – Mount point – Processes and threads – Multi-threading – Semaphores – Mutex – CPU process scheduling – Concept of deadlock – Services and Daemons – Introduction to Networking – Network file systems – Elements of system administration – Principles of topography – Typesetting in LaTeX – Elements of bibliography and citation – The Harvard system.

UNIT – II: Fortran-90

Evolution of Fortran language – Different Fortran compilers – Skeleton of a general Fortran 90 program – Free source format and character set – Specifications – Derived types – Control Structure – CASE construct – New features of DO loop: EXIT, CYCLE statements, Control clauses – Concept of internal, and external procedures, modules and INTERFACE blocks – Concept of scope – CONTAINS statement – Procedure Arguments – Optional arguments – Keyword arguments – Recursive procedures – Modules – Array Processing – Terminology and Specifications – Whole array operations – Vector subscripts – Array assignment – Array constructor – Allocatable dynamic array – Pointers and Dynamic Data Structures – Concept of pointers – Example programs.

UNIT - III: C++

Introduction – Algorithms – Control Structures – if Selection Statement – if-else statement – do-while repetition Statement – Nested Control Statements – Assignment Operators – Increment and decrement operators – break and continue Statements – Logical Operators – C++ math library functions – Function definitions with multiple parameters – Function prototypes – C++ standard library header files – Random Number Generation – Inline functions – Arrays – Declaring arrays – Examples using Arrays – Passing arrays to functions – Pointer variable declarations and initialization – Pointer Operators – Passing arguments to functions by reference with pointers – Using const with pointers – Introduction to operator overloading.

UNIT - IV: Laboratory Exercise Session

The following exercises have to be done in Fortran 90 or in C++: Swapping of two numbers – Counting – Factorial Computation – SINE computation – Base Conversion – Factoring Methods – Array Techniques – Display the Pascal Triangle – Generate prime numbers between 1 to N – Generate Fibonacci series up to N number – Concatenating two strings – Reversing the string – Finding the substring of a given string – Summation of a sin, cos and exponential series – Matrix computations – Random number generation.

PHYS-437: DIFFERENTIAL EQUATIONS and TRANSFORM TECHNIQUES

UNIT – I: Ordinary Differential Equations

First order ODE's – Separable ODE's – Orthogonal trajectories – Physical modeling – Second order linear ODE's – Differential operators – Physical modeling – Higher order linear ODE's – Homogeneous and inhomogeneous differential equations – Series solution of ODE's – Frobenius method – Strum-Liouvllie problem – Orthogonal eigenfunction expansions.

UNIT - II: Partial Differential Equations

Introduction to partial differential equations – Introduction to curvilinear coordinates – Cylindrical polar and spherical polar systems – Review of vector calculus – Divergence, curl and Grad in polar system – Solution by analytical methods – Solution of (i) Laplace, (ii) Poisson, (iii) Helmholtz wave and (iv) diffusion equations in Cartesian and polar coordinate systems.

UNIT – III: Laplace Transforms

Laplace transforms – Inverse transforms – Linearity and Shifting theorems – Laplace transform of derivative of a function – Laplace transform of integral of a function – Unit-step function – *t*-shifting – Short impulses – Dirac-delta function – Convolution – Integral equations – Application to solve differential equations.

UNIT – IV: Fourier Transforms

Introduction to Fourier analysis – Half range Fourier series – Harmonic analysis and applications – Forced oscillations – Finite and infinite Fourier transforms – Fourier sine and cosine transforms – Complex Fourier transforms – Fourier expansion and inversion formulas – Convolution theorem – Applications to solutions of partial differential equations.

HYS-440 Laboratory

General Experiments

- 1. Determination of Lande's g factor of electron by ESR.
- 2. Study of Geiger-Muller counter: Study of Attenuation coefficient
- 3. Study of Geiger-Muller counter: Absorption of Gamma rays
- 4. Fourier analysis of a square wave.
- 5. Study of superconductivity.
- 6. Microwaves bench: Study of standing waves and measure the wavelength of microwave source
- 7. Microwaves bench: Study of Fabry-Perot interferometer
- 8. Study of Chuha's circuit.
- 9. X-ray Diffraction: study of simple cube system
- 10. Cooling curve
- 11. Transition temperature of YBCO Superconductor
- 12. Piezoelectric effect

Electronics Experiments

- 1. Integrator and differentiator using operational amplifier.
- 2. Wein bridge oscillator using operational amplifier.
- 3. Study of comparator using operational amplifier.
- 4. Study of multivibrators using operational amplifier.
- 5. Logic gates and boolean algebra.
- 6. Half and full adder using logic circuits.
- 7. Decoders using logic circuits.
- 8. Study of flip flops.

PHYS-441: QUANTUM MECHANICS – I

Unit I: Quantum theory of spherically symmetric systems

Particle in a spherically symmetric potential – Angular wave function – Radial equation for a free particle, spherical trap - Hydrogen atom - Spin of an electron - Addition of angular momenta.

Unit II: Symmetry in Quantum Mechanics

Symmetries, Conservation laws, and Degeneracies - Discrete symmetries, Parity, or Space Inversion - Lattice translation as a discrete symmetry – Time reversal discrete symmetry.

Unit III: Pictures of Quantum Mechanics

Schrodinger picture - Heisenberg picture - Interaction picture - Relation among different pictures - Ehrenfest theorem.

Unit IV: Time independent perturbation theory

Non-degenerate perturbation theory – Degenerate perturbation theory – The fine structure of hydrogen – The Zeeman effect – The Stark effect – Hyperfine splitting

Unit V: Variational Principle and WKB approximation

Variational principle – The ground state of helium – The hydrogen molecular ion – WKB approximation – Tunneling through potential barriers.

PHYS – 442: CLASSICAL ELECTRODYNAMICS

UNIT - I: Boundary value problems & Special techniques

Boundary conditions and uniqueness theorems — Conductors and second uniqueness theorem — Boundary value problems with linear dielectrics — Multipole expansion — Origin of coordinates in multipole expansions.

UNIT - II: Magnetostatics and Electrodynamics

Lorentz force law and Biot-Savart law — Scalar and vector potentials — Multipole expansion of vector potential—Calculation of field of a magnetized object—Amperes law in magnetized materials and Auxiliary field **H** — Magnetostatic boundary conditions — Faraday's law and Lenz's law — Calculation of energy density in magnetic fields — Electrodynamics before Maxwell — Maxwell's correction of Ampere's law — Derivation of Maxwell's equations in vacuum and in matter.

UNIT – III: Electromagnetic waves

Electromagnetic waves in vacuum — Wave equation for E and B — Reflection, refraction of electromagnetic waves — Snell's law and Fresnel's law — Poynting theorem and its derivation — Electromagnetic waves in matter — Propagation of electromagnetic waves in linear media — Reflection and transmission at normal and oblique incidence — Absorption and dispersion of electromagnetic waves — Electromagnetic waves in conductors — Reflection at a conducting surface — Interference, diffraction and polarization.

UNIT – IV: Potentials and Radiation

Potential formulation — Gauge transformations — Coulomb and Lorentz gauge — Retarded potentials of continuous charge distribution — Derivation of Jefimenko's Equations — Retarded potentials of point charges — Lienard-Wiechert potential — Fields of a moving point charge — Electric dipole radiation — Energy radiated by an oscillating electric dipole — Radiation from moving charges — radiation fields — Derivation of Larmor formula – Relativistic formulation of Maxwell's equations.

Textbook

1. David J Griffiths, Introduction to electrodynamics, Prentice Hall (1999) Third Edition

Supplementary Reading

- 1. John David Jackson, Classical Electrodynamics, John Wiley & Sons (1999) Third Edition.
- 2. Matthew N. O. Sadiku, Elements of Electromagnetics, Oxford University Press (2002) Third Edition.

15 hours

15 hours

PHYS-443: SOLID STATE PHYSICS

Unit I: Crystal structure

Classification of solids – liquids – amorphous glassy states, characteristics and structure – Bravais lattice – simple – body centered and face centered cubic lattices – Primitive cell, Wigner-Seitz cell and conventional cell. Crystal structures and lattice with basis – Hexagonal close packed and diamond structure – point groups – space groups – Miller indices – Reciprocal lattice – Brillouin zones – crystal diffraction – Laue – Power – Rotating – crystal methods.

Unit II: Crystal Binding and Lattice dynamics.

Ionic cohesive energy – Covalent – Metallic Vander Waals and hydrogen bonded crystals – Vibrational modes – one, two and three dimensional lattices – Thermal conductivity – Elastic constants – Phonon dispersion relation – Localised modes.

Unit III: Free Electron Theory and Semiconductors

Transport properties – electronic specific heat – electrons in a periodic potential – energy band – Bloch's theorem, Kronig – Penney's theorem – Band Structure – Carrier concentrations – Intinsic semi-conductor – Imputiry states – Semiconductor states – Electrical conductivity, mobility – Magnetic field effects – Cyclotron resonance and Hall effect.

Unit IV: Superconductivity

Occurrence of Superconductivity – Destruction of superconductivity by magnetic fields – Meissner effect – Heat capacity – Energy gap – Microwave and IR properties – Isotope effect – Thermodynamics of the superconducting transistors – London equation – Coherence length – BCS theory of superconductivity – Qualitative treatment of DC and AC Josephson effect.

Unit V: Electrical and Magnetic Properties

Ferro electric crystals – Classification of polarization – Catastrophe – Landau theory of phase transition – Second order transition – First order transition soft optical phonons – Anti ferro electricity – Ferro electric domains – Piezoelectricity – Ferro electricity. Dia – paramagnetism – Quantum theory of para magnetism – ferro – Ferri – Anti ferri magnetism. Curie Neil temperature – Magnetism and susceptibility – Ferro-magnetic domains – Magnons.

Textbook

1. N. W. Aschcroft and N. D. Mermin, Solid state physics, Holt, Rineheart and Winston, New York (1976)

Supplementary Reading

- 1. C. Kittel, Introduction to solid state physics. John Wiley (2003) Seventh Edition.
- 2. A. J. Dekker, Solid state physics, MacMillan (1981).
- 3. Ali Omer, Elementary solid state physics, Pearson Education (1999),
- 4. L. V. Azaroff, Introduction to solids, Tata McGraw Hill (2008),

12 hours

PHYS-444: NONLINEAR DYNAMICS

Unit I:

Nonlinear waves - Nonlinear partial differential equations - physical examples - AKNS method - Applications of solitons - Introduction to synergetics - examples from Physics, Chemistry, Biology, Computer Science, Economics, Ecology and Sociology.

Unit II:

Survey of first and second order differential equations - inhomogeneous - non-linear differential equations linear and non-linear dynamical systems – solutions – examples from physics.

Unit III:

Stability of solutions from non-liner dynamics systems - phase portrait - trajectories - limit cycles - driven pendulum - Vender Pol and Durfing oscillator - bifurcations - Hopf bifurcation - period doubling route to chaos Poincare Map – Logistic Map – strange attractors – Lorentz attractor.

Unit IV:

12 hours Oscillating chemical system - Lotka-Volterra equations - Brusselator model - Beluosov Zhabotinsky reaction chemical chaos - self-organization. Applications to Biology, predator - prey problem, morphogenesis.

Textbooks

- 1. H Haken, Synergetics, Springer Berlin (1983).
- 2. H Haken, Advanced Synergetics, Springer Berlin (1983).
- 3. I. Prigogine, Order out of chaos, Fontana (1984).

12 hours

12 hours

PHYS-445: MEASUREMENT SYSTEMS and DATA ACQUISITION

UNIT – I: Basic concepts

Significance of measurement - Role of instruments in industrial processes - Block representation of measurement systems - Need for calibration and standards - Instrument parameters: sensitivity, accuracy, resolution, span, range – Classification of instruments – Generalized system configuration – Functions and characteristics of instruments and measurement systems – Errors in measurement – Analysis, sources of errors and techniques for error-minimizing - Classification of instrument transducers - Input and output characteristics - Static and dynamic response - Linearity and hysteresis.

UNIT - II: Transducers and Measurement Systems

- Examples of (i) resistive, (ii) inductive, (iii) capacitive, (iv) thermoelectric, (v) photo-electric, (vi) piezoelectric, (vii) ionization and (viii) Hall-effect based transducers - Displacement measurement - Force and torque measurement - Pressure and sound measurement - Relationship between absolute, atmospheric and gauge pressures - Fluid flow measurement - Temperature measurement - Measurement of light - Measurement of magnetic field.

UNIT - III: Signal conditioning and circuits

The need for signal conditioning – Requirements and characteristics of signal conditioners – DC and AC bridge circuits - Operational amplifiers in instrumentation - Unity gain buffer - Instrumentation amplifier - Log and antilog amplifiers - Constant current source - Voltage and current conversion - Passive and active filters.

UNIT - IV: Data acquisition and Virtual Instrumentation

Introduction to RS232, RS485 – Basics of Interfacing – IEEE 488.2 standards and GPIB – Introduction to USB, PCMCIA, VXI, SCXI, PXI – Historical Perspective and advantages of Virtual Instrumentation (VI) – Defining VI - Block Diagram & architecture of VI - Data Flow Techniques - Graphical Programming in Data Flow -Comparison with conventional programming - Introduction to LabVIEW.

Textbooks

PHYS-446 MICROPROCESSORS AND APPLICATIONS

Unit I: Architecture of 8 bit Microprocessor

Addressing modes – instruction and times – classification – machine control operator – FORMAT – Types of memory –R/W, (RAM) – ROM, PROM, EPROM, EEPROM – I/O interfacing and addressing – display and keyboard interfacing and programming – interrupts, stacks, subroutines, 8155, 8355, 8212 clock generator and bus drives

Unit II: Assembly Language Programming

Programming exercise for 8085 – involving addition, subtracting and logical operations only – Monitor programme – assemblers, basic interpreters. Serial and parallel data transmission: Perriperheral chips – intel 8275, 8279, USART, instrumentation buses, RS232C, IEEE488 bus CAMAC buses.

Unit III: Digital Interfacing

KB, displays optical motor shift encoders – analogue interfacing D/A and A/D converters – process control – digital filters.

Unit IV: Trends in Microprocessor Technology

16 bit CPU, 8086, 8088 – 8086 internal architecture. Assembly language programming of 8086 – simple sequence programs Flags Jumps while – Do implementation IF – THEN, IF-THEN-ELSE and multiple – IF-THEN-ELSE programme – 8086 instruction and assembly direction. Computer systems peripherals, Raster scan, CRTs vector scan CRTs – Floppy disk controllers, hard disk interfacing Data communication networks – serial data transmission mode IBM PC architect.

Phys 447 Basics of Astronomy and Astrophysics

Unit I: Astronomy- Coordinate System- Spherical Trigonometry, Precision, Time, Heliocentric Corrections, Methods of observations, Telescopes at different wavelength, Detectors at different wavelength, Atmospheric effects at different wavelengths, Resolution, Background, Aberrations, Luminosity Bias, Confusion Limit Distance measurements using parallax method, Newton's' Gravitation law and Kepler's Law in Distance and Mass Measurement. 10Hrs

Unit II: *Stars* – Stellar Magnitudes and Colors, Brightness and distance, Luminosity, temperature and spectral class, the motion of stars relative to the Sun, the masses of stars, the Hertzsprung–Russell diagram and main-sequence stars 8Hrs

Unit III : Stellar Structure – Equations of Stellar Structure – Solutions to Equations of Stellar Structure, Toy Stellar Models: Homologous Stellar Models, the Radiative Stellar Envelope, Fully Convective Stars with H~ Opacity, Observational Aspects of Stellar Atmospheres, Continuum Radiation, Lines 8Hrs

Unit IV Stellar Evolution – Pre-Main-Sequence Collapse, Evolution of High-Mass Stars, Evolution of Low-Mass Stars, Late-Stage Evolution of Stars, Supernova (Type II), White Dwarfs, Neutron Stars and Black Holes, Pulsars, Binary Stars and Accretion 8Hrs

Unit V: Large Scale Structure of Universe- Hubble's Law, Galaxies and Cosmology -Evolution of the Universe, Formation of Dark-Matter Halos, Galaxy Formation, Morphological Classification of Galaxies, the Evolution of Galaxies, Active Galactic Nuclei, Features of Active Galactic Nuclei, Taxonomy of Active Galactic Nuclei, Radio Galaxies, Quasars, Luminosity Function of Galaxies and Quasars, Distribution of Matter, Extragalactic Background Radiation 14Hrs

Textbooks:

PHYS- 530: Condensed Matter Physics Specialization Experiments

(3 CREDITS)

- 1. X-ray diffraction.
- 2. Impedance spectroscopy.
- 3. Infrared spectroscopy.
- 4. Differential scanning calorimetry with thermal analysis.
- 5. UV-VIS-IR spectroscopy.
- 6. High field magnetic hysteresis using VSM.
- 7. Superconductivity.
- 8. Emission spectroscopy.
- 9. Transmission Electron Microscope
- 10. Electron Probe Microscope Analysis
- 11. Electron Spin Resonance
- 12. Energy Dispersive Analysis of X-Rays
- 13. Nuclear Magnetic Resonance

PHYS 550 Electronics Specialization Experiments:

(3 CREDITS)

- 1. First order active filters using operational amplifier.
- 2. Second order active filters using operational amplifier.
- 3. Counters and registers using logic circuits.
- 4. Decade counting unit.
- 5. Study of 8-bit microprocessor.
- 6. Study of 16 bit microprocessor.
- 7. Study of 8051 microcontroller.
- 8. Study of lockinamplifier.
- 9. Amplitude modulation.
- 10. Detection of AM signals.
- 11. Study and detection of Frequency modulation.
- 12. Pulse modulation.
- 13. Study of multiplexing and demultiplexing.
- 14. Digital multiplexer.
- 15. LabVIEW and Virtual instrumentation laboratory.

PHYS570- LASER Specialization Experiments:

(3 CREDITS)

- 1. Numerical aperture of optical fiber and propagation of light through optical fiber.
- 2. Intensity profile of laser through optical fiber and determination of refractive index profile.
- 3. Refractive index by Brewster angle setup.
- 4. Study of Faraday effect using He-Ne laser with AC modulator.
- 5. Study of Electro-optic effect (Pockel effect) with AC modulator.
- 6. Study of Electro-optic effect (Kerr effect).
- 7. Study of Acousto-Optic effects.
- 8. Study of Second Harmonic generation
- 9. Study of Passive Q switching in Nd:YAG laser
- 10. Study of Active Q Switching in Nd YAG Laser
- 11. Study of Laser bean characteristics (beam divergence, spot size, intensity profile) using He-Ne laser
- 12. Estimating Coherence Length of the Given Light Source.
- 13. Digital holography.
- 14. Estimation of Stokes Parameter

PHYS- 531: QUANTUM MECHANICS – II

Unit I: Time dependent perturbation theory

Time dependent perturbation theory – transition probability – constant perturbation – harmonic perturbation – Fermi Golden rule – radiative transitions in atoms – dipole transition – selection rules – sudden and adiabatic approximation.

Unit iI: Semiclassical theory of Radiation

Interaction of Light with Matter: Electric dipole Hamiltonian, absorption and stimulated emission, absorption spectroscopy, Raman scattering.

Unit III: Identical Paricles

Systems of identical particles – Exchange degeneracy – Fermi and Bose particles – the exclusion principle – ensemble of indentical systems – spin statistics connection – Slater determinant.

Unit IV: Quantum theory of Scattering

Scattering theory – scattering particles – potential scattering – partial wave analysis – phase shifts scattering length – integral equations in terms of Green's function – Born approximation and its validity.

Unit V: Relativistic Quantum Mechanics

Relativistic wave equations – the Klein-Gordon equation – Dirac equation – Dirac matrices – free Dirac particles – spin magnetic moment – spin-orbit interaction – central potential – hydrogen atom – Hole theory and positrons.

Textbooks

PHYS-532: ATOMIC AND MOLECULAR PHYSICS

Unit I:

Electromagnetic spectrum - Absorption or Emission of radiation - Line width- Natural line broadening-Doppler broadening - Pressure broadening - Removal of line broadening - X-ray Spectra - Emission and absorption spectra of X-rays. Regular and irregular doublet laws - X-ray satellites - Photoelectron spectroscopy - Ultravoilet photoelectron spectrometers - XPS techniques and Chemical information from photoelectron spectroscopy – Auger electron spectroscopy.

Unit II:

Microwave Spectroscopy: Classification of Molecules - The rotation of Molecule – Rotational spectra of Rigid Diatomic molecule- Isotope Effect in Rotational Spectra- Intensity of Rotational Lines- Non-rigid Rotator-Vibrational Excitation Effect- Linear Polyatomic molecules- Symmetric top molecules- Asymmetric top molecules - Stark effect- Quadrupole Hyperfine interaction - Microwave spectrometer - Information derived from Rotational spectra - Infrared Spectroscopy: Vibrational Energy of a Diatomic molecule - The Diatomic Vibrating Rotator - Break down of Born-Oppenheirmer Approximation - The Vibrations of Polyatomic molecules - Rotation-Vibration spectra of Polyatomic molecules - Analysis by Infra-red Techniques- IR spectrophotometer - Fourier Transform- IR spectrophotometer- Applications - Frank-Condon principle and dissociation energy.

Unit III:

Raman Spectroscopy: Theories of Raman scattering - Rotational Raman Spectra - Vibrational Raman Spectra - Mutual Exclusion principle - Raman Spectrometer - Polarisation of Raman Scattered light - Structural determination from Raman and IR spectroscopy - Near IR FT-Raman spectroscopy - Laser Spectroscopy: Basic principles: Comparison between conventional light sources and lasers-Saturation-Excitation methods-Detection methods-Laser Wavelength Setting-Doppler Limited Techniques.

Unit IV:

Nuclear Magnetic Resonance Spectroscopy: Basic principles - magnetic resonance - relaxation processes pulsed (Fourier Transform) NMR - wide line NMR spectrometers - Spectra and molecular structure - chemical shifts - spin-spin coupling - integration - applications - Electron Spin Resonance Spectroscopy: Basic principles – ESR spectrometer – ESR spectra – Hyperfine interaction – g-factor – line widths – applications.

UNIT V:

NOR Spectroscopy: Ouadrupole Hamiltonian- Nuclear Ouadrupole energy level for axial and non-axial symmetry - Experimental techniques and applications - Mossbauer Spectroscopy: Principles of Mossbauer spectroscopy - Chemical shifts - Quadrupole splitting and Zeeman splitting - applications of Mossbauer spectroscopy – applications.

Textbooks

12 hours

PHYS-533: LIQUID AND POLYMER PHYSICS

Unit I: Liquid State

Classification of liquids (ionic, molecular and simple) and interactions in liquids– idea of attractive and repulsive potentials -stability condition of bond -Hydrogen molecule –neon liquid - Lenard Jones potential in liquid- theory of scattering in neon liquid - radial distribution function - structural determinations.

Unit II: Equilibrium Structure of Dense Fluids

Molecular distribution – Van der Waals equation – liquid in canonical ensemble- second virial term – general virial approach thermodynamic functions in dense fluids – equation for pair distribution functions Kirkwood superposition approximation – critical phenomena: critical properties of Van der Waals fluid.

Unit III: Liquid Solutions

Ideal and non-ideal solutions – Henry's law – partial molar quantities – Euler's theorem –fugacity –chemical potential- binary mixtures Gibbs - Duhem ruleof activity coefficient – application - excess thermodynamic functions of mixing – lever rule - two component system with solid and liquid phases - phase diagram and interpretation.

Unit IV: Liquid Crystals

Classification and of liquid crystals and mesoscopic phase transitions (nematic, semetic, cholestric) – Landau theory phase transition and Marier Saupe theory in lquid – detection by microscopic techniques – phases of the lyotropic system and their application in Biological systems – thermotropic liquid crystal and its applications.

Unit V: Polymer Physics

Classification – molecular weight and size – addition polymerization and copolymerization – determination of molecular weight and size – structure properties: crystal structure of polymers – morphology of crystalline polymers – XRD studies – viscoelasticity of polymers – acoustical technique – glassy state and glass transition

PHYS-534: ADVANCED ELECTRONIC DEVICES AND CIRCUITS

Unit I: Advanced Electronic Devices

Advanced Electronic Devices: Schottky diodes, MOSFET, IGBT, Thyristors, Diac, Triac, Charge-coupled devices – Structure and working, V-I characteristics and applications.

Unit II: Other Electronic Devices

Other Electronic Devices: Electro-optic, magneto-optic, Acousto-optic, Piezo-electric, Electro-strictive, magneto-strictive effects, related material properties for these effects – application in sensor and actuator devices.

Unit III: Programmable devices

Programmable devices: PAL, PLA, PLD, CPLD and FPGA – Structure and working, comparison with standard logic devices and application – Memories – Classification of memories, Static and dynamic shift register ROM, PROM, EPROM – Principle and operations, Read/write memories – SRAM, DRAM, DDRAM – Principle and operations – recent advancement in solid-state memories.

Unit IV: Data conversion circuits

Data conversion circuits: Digital to Analog conversion – Weighted and R-2R ladder networks, Frequency to Voltage converters, Analog – to – Digital conversion methods – integrating – single and dual slope converters, Successive approximation, Voltage to frequency and flash converters – Principle, operation and applications.

UNIT – V: Data acquisition and Virtual Instrumentation hours

Introduction to RS232, RS485 – Basics of Interfacing – IEEE 488.2 standards and GPIB – Introduction to USB, PCMCIA, VXI, SCXI, PXI – Historical Perspective and advantages of Virtual Instrumentation (VI) – Defining VI – Block Diagram & architecture of VI – Data Flow Techniques – Graphical Programming in Data Flow – Comparison with conventional programming – Introduction to LabVIEW.

PHYS-535: LASER THEORY

UNIT : I BRIEF REVIEW OF WAVE & PARTICLE NATURE OF LIGHT

Maxwell's equations; Wave equations, Origin of refractive index; Coherence; Quantum theory of Atomic energy levels & selection rules for single electro & multi-electron atoms.

UNIT : II RADIATIVE TRANSISTION, PROPERTIES OF MOLECULES

Decay of excited states, Emission broadening & line width due to radiative decay,

Different broadening mechanism of emission spectra, Radiation laws- cavity radiation, absorption and stimulated emission- Einstein's A & B Coefficient.

UNIT : III INTRODUCTION TO LASERS

Condition for producing a laser – population inversion, gain & gain saturation; Saturation intensity, Threshold requirement for a laser, laser oscillation above threshold. Requirements for obtaining population inversion-2, 3 and 4 level systems; Steady state and transient population process that destroy population Inversion.

UNIT : IV LASER PUMPING REOUIREMENTS & TECHNIOUES

excitation threshold requirement, pumping pathway, Specific excitation parameters associated with optical & particle pumping.

UNIT: V LASER RESONATORS

Laser cavity modes- longitudinal & transverse cavity modes . Properties of laser modes - Mode characteristics & effect of modes in gain profile, Stable laser resonators & propagation of Gaussian beams using ABCD matrices.

PHY-536 NONLINEAR OPTICS

Unit I:

Maxwell Equations, Wave Equations in various media and its propagation (Brief Survey)- Origin of Complex Refractive Index - Classical theory of Optical Absorption (Electron OscillatorModel) and Dispersion (Lorentz Oscillator Model)- Classical theory of anharmonic oscillators.

Unit II:

Wave equations description of nonlinear optical susceptibilities - Symmetries in Nonlinear Optical systems-Frequency and intensity dependence of polarization and dielectric susceptibility- First order and higher order susceptibilities

Unit III :

Second order optical nonlinearities Second harmonic generation -sum and difference frequency generation, parametric processes - Simple theory and calculation of nonlinear polarization -Various phase matching technique in SHG

Unit IV:

Third order optical nonlinearities - Third harmonic generation, Four wave mixing, Kerr Nonlinearity, Intensity dependent effect, Self Phase modulation, Cross phase modulation Stimulated Raman Scattering (SRS), Stimulated Brillioun Scattering, Parametric gain -Parametric amplification and oscillation

Unit-V

Applications frequency mixing and up conversion -Difference frequency generator, Optical Phase ConjugationTheory and Applications, Photorefractive effect and applications, SolitonsTheory and applications – Optical bistability.

PHYS-537: EXPERIMENTAL DESIGN

UNIT – I:

Measurement of fundamental constants: e, h, c – Measurement of high and low resistances, inductance and capacitance - Detection of X-rays, Gamma rays, charged particles, neutrons - Ionization chamber -Proportional counter - GM counter - Scintillation detectors - Solid State detectors -

UNIT – II:

Emission and Absorption Spectroscopy – Measurement of Magnetic field – Hall effect – Magnetoresistance – X-ray and neutron Diffraction.

UNIT – III:

Vacuum Techniques – Basic idea of conductance, pumping speed – Pumps: Mechanical Pump – Diffusion pump - Gauges - Thermocouple gauge - Penning gauge - Pirani gauge - Hot Cathode gauge - Low temperature systems – Cooling a sample over a range up to 4 K – Measurement of low temperatures.

UNIT – IV:

Measurement of energy and time using electronic signals from the detectors and associated instrumentation – Signal processing – A/D conversion – multichannel analyzers – Time-of-flight technique – Coincidence Measurements - true to chance ratio - Correlation studies. Error Analysis and Hypothesis testing - Propagation of errors – Plotting of Graph – Distributions – Least squares fitting – Criteria for goodness of fits – Chi square test.

PHYS-539 PLASMA PHYSICS AND CONTROLLED FUSION (45 hours per semester+15 Experimental Demonstration)

UNIT – 1 Collision processes in gases discharge mechanism

Breakdown mechanism of gases, Gaseous discharge, Characteristic of dc Glow discharge, positive column, cathode sheath, negative glow, negative glow and Faraday dark space, Analysis of positive column, Analysis of cathode region.

UNIT –2 Plasma and Plasma Parameters

Definition of plasma, electron and ion temperature, plasma potential, sheath formation and floating substrate, Debye shielding, The Contact Potential, sheath formation and Bohm criterion, cathode sheath, Plasma oscillations, electron oscillations ion oscillation, Ambipolar diffusion.

UNIT - 3 Plasma sources and Applications

Limitations of dc glow discharges, RF discharges, Inductive discharges, power transfer efficiency, matching network, electron-cyclotron resonance discharges, helicon-discharges, surface wave discharges, DBD discharges, characteristics and application of respective discharges, hollow cathode discharge, planer magnetron discharge, plasma etching, dc sputtering, rf sputtering, thin film formation, plasma nitriding, PECVD for nano-material fabrication.

UNIT - 4 Plasma For Controlled Fusion

Fission, Fusion and energy needs, Lawson criterion, Magnetic confinement fusion devices (magnetic mirrors trap, tokomak), Particle trajectories in non-uniforms magnetic and electric fields. Drift approximation. Adiabatic invariants. Plasma as a fluid, plasma heating, Current drive, low hybrid current drive (LHCD), Ion Cyclotron Resonance Heating (ICRH), Ion Cyclotron Resonance Heating (ECRH), Neutral beam injection (NBI). Laser and heavy ion beams fusion, Tokomaks in India and ITER and challenges

UNIT-5 Experimental Demonstration

- 1. Dependence of breakdown voltage on pressure and electrode gap (Paschen Curve).
- 2. Measurement of Plasma parameters by electrostatic probe (Langmuir Prob).
- 3. To measure the plasma parameters by double Langmuir probe
- 4. To launch an ion-acoustic wave and demonstrate collective behavior of the plasma
- 5. Measurement of plasma parameters of a pulsed dc discharges
- 6. Characterization of dc magnetron discharges and estimation of sputtering yield
- 7. Studying the conditions for atmospheric pressure plasmas (Dielectric Barrier Discharges)

PHYS - 551 - STATISTICAL PHYSICS

UNIT I: FOUNDATIONS OF STATISTICAL PHYSICS

Microstate and Macrostate of macroscopic system, Phase space and Phase space density, Liouville theorem, Erogodic hypothesis, Postulate of Equal a priori probabilities, Microcanonical Ensemble, Number of microstates and relation to thermodynamic entropy, Calculation of number of microstates to (a) Ideal gas: Equation of state, Gibbs paradox, correct counting (b) Crystalline solid: Du-long Petit's law, Einstein's theory of specific heat and (c) Paramagnetism: Curie's law, Negative temperature and Schottky anomaly in specific heat (d) Elasticity of a rubber.

UNIT II: CANONICAL ENSEMBLE AND PARTITION FUNCTION

Canonical ensemble canonical partition function, The Darwin Fowler method, Calculation of thermodynamic properties from partition function, Equipartition theorem and Virial theorem, Application of canonical partition function to (a) Ideal gas (b) Crystalline solid (c) Black body radiation: Planck's theory (d) Theory of paramagnetism: Langevin and Brillouin functions (e) Diatomic molecular gas.

UNIT III: GRAND CANONOICAL ENSEMBLE

The chemical potential, Grand canonical ensemble and grand partition function, Fugacity, Relation of grand partition function to thermodynamics, Application to (a) Adsorption desorption process (b) Chemical reactions

UNIT IV: QUANTUM STATISTICS

Density operator, Spin statistics connection, Grand partition function for ideal Bose and Fermi gases, Bose-Einstein, Fermi-Dirac and Maxwell-Boltzmann distributions, Application to (a) Electrons in metals (b) Pauli paramagnetism (c) Landau diamagnetism (d) Theory of White dwarf stars (e) Black body radiation: Bose theory (f) Debye theory of specific heat (g) Bose-Einstein condensation.

UNIT V: PHASE TRANSITIONS

Phase transitions, Order of transition, Order parameter, Critical phenomena and critical exponents, Scaling theory and Universality class, Correlation function and fluctuation dissipation theorem, Landau theory of phase transition, Ising Model, Brag Williams theory, Random walk and diffusion equation, Brownian motion,

PHYS 541 NUCLEAR PHYSICS

Unit I: Nuclear Models:

Gas model – liquid drop model – semi-empirical mass formula – magic numbers – shell model – isomers isospin - parity - magnetic moment electric quadropole moment - collective model.

Unit II: Nuclear Forces:

Introductory ideas about nuclear forces and range. Central force - Deuteron problem - n-p, p-p scattering at low energy - effective range theory - Wigner's hypothesis - electric quadropole moment of Deuteron - Introductory idea about Bartlet, Majorana, Heisenberg exchange forces – concept of Isotopic spin – Yukawa meson theory.

Unit III: Nuclear Decay:

Stability of nuclei – Decay – decay-Gamow's theory Geiger Nutall law - beta-decay – Fermi's theory – neutrino - energies of gamma-spectrum - conservation of parity - weak interactions - selection rule - pair production internal conversion - Gamma decay - selection rule.

Unit IV: Nuclear Reactions:

Conservation laws - Q value - Breit Wigner formula - Nuclear fission reaction - cross section - fission products - energy release - fissioability parameter (theory of fission) - nuclear fusion - thermo nuclear reactions.

Unit V: Elementary Particles:

Classification - symmetries and violations of symmetry - properties and decay models of Baryons, Mesons, Hardons. Tau-Theta Puzzle - stangeness and charm, SU(3) classification - strong interaction - idea of Quarks electro weak and GUT(introductory idea).

PHY-542 LASER SYSTEMS

Unit 1 Special Laser Cavities & Cavity Effects

Unstable resonator, Q-switching, Mode locking, Different Methods, Ring laser, Cavities for producing spectral narrowing of laser output, laser cavities requiring small diameter gain region astigmatically compensated cavities.

Unit Ii Specific Laser System - 1

He -Ne laser, Argon ion laser, Helium Cadmium laser, Copper vapor laser, Carbon dioxide laser, Nitrogen laser, Far Infrared gas laser.

Unit Iii Specific Laser System – 2

Dye lasers, Ruby laser, Nd-YAG laser, Alexandrite laser, Ti-Sapphire laser, Color center laser, Semiconductor lasers.

Unit Iv Specific Laser System – 3

Chemical laser, X-ray Laser, Free electron laser, Excimer laser, Fiber laser

Unit V Ultra Short Pulse Laser

Concept of measuring brief intervals of time Pico seconds & femto second Techniques. Method of generating pulses optical pulse properties & methods of measurement of pico & femto second pulses.

Books

- 1. William T. Silfvast ,Laser Fundamentals (Cambridge University Press)
- 2. Peter W. Milonni & Joseph H. Eberly Lasers.
- 3. Claude Rulliere ,Femto second laser pulses (Springer Verlag Publications)
- 4. S.L. Shapiro, Ultra short light pulses: Picosecond techniques & applications.

PHYS-543: PHYSICS OF AMORPHOUS MATERIALS

Unit I: Preparation

Definitions – preparations of amorphous materials (a) thermal evaporation (b) sputtering (c) melt quenching (d) Gel desiccation (e) solid state diffusional amorphization – Glasses: The glasses transition – theories of glass transition – glass forming systems.

Unit II: Microscopic Structure and Atomic Transport

Diffraction – X-ray absorption spectroscopy – magnetic resonance – structural modeling: Dense random packing – continuous random packing – Theory of ionic conductivity – ionic conductivity in crystalline solids and amorphous solids – electrode polarization – solid electrolyte and fast ion conductors – criterion for fast ion conductors – frequency dependence transport.

Unit III: Dielectric and Electronic Properties

Relation of dielectric constant and polarization – dipolar polarization theory – time dependence of polarization – Cole-Cole distribution – temperature dependence of dipolar polarization – composition and structural effects of glasses – Electron density of states – theoretical calculation – experimental determinations – D.C. electrical conductivity Hlall effect – Frequency dependence conductivity.

Unit IV: Applications

Electrochemical applications – solid state batteries – electrochemical sensors – electronic applications – electro photographic applications – thin film resistors – Solar cells.

Textbooks

PHYS-544: PHYSICS OF CRYSTALLINE MATERIALS

UNIT – I

Materials Preparation and Characterization: Different techniques of growing single, poly and nano crystalline materials, Characterization techniques: X-ray diffraction, Transmission electron microscope, Auger electron spectroscopy and ESCA, Crystal symmetries, Point groups and Space groups of crystalline materials.

UNIT – II

Deposition of thin films by physical methods and vacuum techniques: Thermal, Flash, Electron beam evaporations, Sputtering. Deposition of thin films by chemical methods: deposition of thin films, capabilities and limitations of thin films and their applications.

UNIT – III

Structure of the solid phase: structural disorder, imperfections in crystals: point defects, dislocations and grain boundaries. Thermo dynamics of point defects, Influence of defects on physical properties. Atomic process of solids: Diffusion in solids, Fick's 1st and 2nd laws of diffusion in crystalline materials, Diffusion and Conductivity equations. Phase diagrams for one and two components – solid solutions – interstitials and substitutional solid solutions.

$\mathbf{UNIT} - \mathbf{IV}$

Physical properties of the crystalline materials: Tensors representation of physical properties of stress, strain, piezoelectricity, elasticity, non –linear optical coefficients of electro-optic and photo-elastic tensors in crystalline materials.

Textbooks:

- 1. P. Harmon, Introduction to Crystal Growth. North Holland.
- 2. W.R.Fahrner, Nanoelectronics and Nanoelectronics, Springer

PHYS - 545: SIGNAL PROCESSING AND COMMUNICATION

Unit I : Signals and Sampling

Signals, classification of signals, basic operation on signals, elementary signals, systems, properties of systems, Sampling continuous time signals, sampling a sinusoid, aliasing, sub-sampling, sampling theorem, ideal reconstruction and practical reconstruction: zero order hold.

Unit II: Fourier Representation

Fourier representation for four class of signals, discrete – time periodic signals, discrete- time Fourier series, continuous time periodic signals and the Fourier series, discrete time non- periodic signals, and the discrete time Fourier transform, continuous time non periodic signals and the Fourier transform. Parseval relationship, Time-Bandwidth product, Duality.

Unit III COMMUNICATIONS SYSTEMS

Basic information theory; Modulation and detection in analogue and digital systems; Sampling and data reconstructions; Quantization & coding; Time division and frequency division multiplexing; Equalization; Optical Communication : in free space & fiber optic; Propagation of signals at HF, VHF, UHF and microwave frequency; Satellite Communication.

Unit IV MICROWAVE communications

Microwave Tubes and solid state devices, Microwave generation and amplifiers, Waveguides and other Microwave Components and Circuits, Microstrip circuits, Microwave Antennas, Microwave Measurements, Masers, lasers; Microwave propagation. Microwave Communication Systems terrestrial and Satellite based.

Textbooks:

- 1. S.Haykin and B.Van Veen, Signals and Systems (II edition); Wiley Student Edition.
- 2. B.P.Lathi, Signal processing and linear systems; Oxford University Press Inc.(USA),2003.

10 hours

13 hours

10 hours

PHYS 546: ELECTRONIC MEASUREMENT TECHNIQUES AND ANALYSIS UNIT – I:

Measurement Basics: Significance of measurement - Role of instruments in industrial processes - Block representation of measurement systems - Need for calibration and standards - Instrument parameters: sensitivity, accuracy, resolution, span, range - Classification of instruments - Generalized system configuration - Functions and characteristics of instruments and measurement systems - Errors in measurement - Analysis, sources of errors and techniques for error-minimizing

UNIT – II

Transducers: Classification of instrument transducers - Input and output characteristics - Static and dynamic response – Linearity and hysteresis. Examples of (i) resistive, (ii) inductive, (iii) capacitive, (iv) thermoelectric, (v) photo-electric, (vi) piezo-electric, (vii) ionization and (viii) Hall-effect based transducers - Displacement measurement - Force and torque measurement - Pressure and sound measurement - Relationship between absolute, atmospheric and gauge pressures - Fluid flow measurement - Temperature measurement -Measurement of light - Measurement of magnetic field.

UNIT III:

NETWORK THEORY: Network analysis techniques; Network theorems, transient response, steady state sinusoidal response; Network graphs and their applications in network analysis; Tellegen's theorem. Two port networks; Z, Y, h and transmission parameters. Combination of two ports, analysis of common two ports.

UNIT IV:

Network functions : parts of network functions, obtaining a network function from a given part. Transmission criteria: delay and rise time, Elmore's and other definitions effect of cascading. Elements of network synthesis.

Text Books:

- 1. Van Valkenburg, Network Analysis; 3rd edition, Prentice-Hall, 1974.

10 hours

PHYS – 547: VISUAL PROGRAGRAMMING (Pre-requisite: PHYS-436)

UNIT – I:

Review of C++ programming – C++ streams – Console streams – Console stream classes-formatted and unformatted console I/O operations, manipulators – File streams – File pointers and manipulations of file I/O – Exception handling – Object-oriented paradigm – Elements of object oriented programming – Merits and demerits of OO (object oriented) methodology – Classes and objects – constructors and destructors – Operator overloading – Data encapsulation – Member functions – Inheritance – Virtual functions – Polymorphism.

UNIT – II:

Review of procedure oriented programming – Introduction to events – Event handling principles – GUI concepts – Overview of Windows programming – Creating the window – Displaying the window – message Loop – windows procedure – painting and repainting – WM_PAINT message – WM_DESTROY message – An Introduction to GDI – Child window control.

UNIT – III:

Visual Basic Programming: IDE – Introduction to Forms – Intrinsic Controls –Working with files – Accessing databases with data control – Classes and Objects – ADO Object Model – Using Windows Common dialogs – Introduction to dynamic link library.

UNIT – IV:

Visual C++ Programming: Windows Programming Model – Visual C++ components – Microsoft foundation classes Library (MFC) – Application Framework – Using AppWizard – Basic Event handling – Graphics Device Interface, Colors and fonts – Modal and Modeless Dialogs – Windows common dialogs – Windows Message Processing and Multithreading.

UNIT - V: Laboratory Exercise Session

The laboratory sessions involve exercise on the following: Creation of files and file handling – Classes with primitive data members – Classes with arrays as data members – Classes with pointers as data members – String Class – Classes with constant data members – Classes with static member functions – Operator Overloading – Function Overloading – Writing code for keyboard and mouse events – Creating Dialog Based applications – Creating SDI and MDI applications.

PHYS 548 Quantum Entanglement

(3 credits)

Unit: 1 12 Postulates of Quantum Mechanics. Dirac formalism, EPR paradox; hidden variable & Bell's theorem; Quantum calculation of the correlation in Bell's theorem; Bell's theorem without inequalities (GHZ equality). Unit:2 12 Entanglement as physical resource, Quantum circuits; Quantum search algorithm, Quantum Computers-Physical realization, Condition for quantum computation, Different implementation schemes for quantum computation Unit:3 13 Quantum information theory (Distinguishing Quantum states, Data compression, Classical & Quantum information & noisy Quantum channels), Quantum Cryptography (Bennett- Brossard protocol) 8 Unit 4: Quantum Non demolition measurement Quantum key distribution and security of quantum key distribution.

Book:

1. M A Nielsen & I L Chuang, Quantum Computation & Quantum Information Cambridge, 2001.

2. Mikio Nakahara and T Ohmi, C Quantum Computing ,RC Press (2007).

PHYS-559: MATHEMATICAL METHODS IN PHYSICS -II

UNIT – I: Linear Algebra

Linear vector spaces - Basis- Subspace - Dimension - Linear dependence and independence - Basis sets - Norm and Inner product - Cauchy-Schwarz Inequality - Orthogonality and Completeness -Eigenvalues and Eigenvectros - Matrix representation - Change of orthonormal basis.

UNIT -II: Hilbert Spaces and Operators

Hilbert space - Linear Functions -Families of orthogonal polynomials as basis sets in function space (Gram-Schmidt orthogonolization) – Operators – Linear operators – Hermitian, Unitary and Projection operators – Inverse and Rank of an operator - Rotation matrices in 2 and 3 dimensions - Pauli matrices.

UNIT - III: Vector Analysis

Vectors and Scalars - Direct angles and direction cosines - Vector algebra - Scalar product - Vector product -Scalar triple product – Vector triple product –Vector identities – Differential operators incurvilinear coordinates - Vector and Scalar fields.

UNIT – III: Tensors

Introduction - Fundamentals of tensors - Cartesian Tensors - Algebra of Cartesian tensors - Outer product -Contraction - Quotient theorem - Symmetric and Skew-symmetric tensors - Kronecker& Levi-Civita tensors -Examples and Applications in physics.

UNIT – II: Group Theory

Introduction to Groups, fields - Definitions and examples of physically important finite groups - Point groups -Multiplication table - Subgroups - Cyclic groups, center, classes, cosets, Lagrange Theorem - Representations of finite groups - Irreducible representation - Characters - Orthogonality theorem - Schur's character table -SU(2) - SU(3) - Simple applications.
